Sensory storyline at the library

Many children, storyline is the highlight of the Georgia Public Library. Not only storyline has the storyline for children and caregivers, but it includes many elements that are not in children's development. Reading stories exposes children to new words and new worlds. It also demonstrates the beauty of how to read, how to look for stories, and how to enjoy stories. Sensory storytime provides opportunities for social interactions between children and their caregivers.

However, children with sensory needs, the sensory library is a popular destination for many individuals. Children can be overwhelmed and overstimulated, which can result in heightened sensory experiences. The development of a sensory storyline program by Tamarack, the Librarian, Margaret Lane.

Sensory storytime creates a space and opportunity for children with sensory needs, as sensory storytime helps children to focus and gain control over their own environment. This can help children to celebrate their successes and build their confidence.

Ann Evans

"Sensory storytime is all about creating and implementing this program in the community. It is a way to bring children of all ages and abilities together in a fun and engaging environment. It is an opportunity to celebrate their successes and build their confidence. It also provides an opportunity for caregivers to learn more about how to best support their children.

For more information about sensory storytime or other library programs, please contact Margaret Lane, the Library’s Sensory Storytime Coordinator at 404-555-5555.

Covid again surging in Wilco

Continued from page 1

While some evidence may suggest that Omicron infects even more people rapidly and more commonly than previous variants, health researchers and officials do not yet know for sure whether Omicron will replace Delta and other variants in the future.

"It is difficult to determine what degree of concern exists due to pre-existing immunity and the intrinsically lower virulence of Omicron," said Dr. Daniel Eichler from the University of Washington School of Medicine.
